DISCUSSION AND CONCLUSION

Results of our attended noise surveys confirm that noise emissions from the Tangaratta site are compliant with the criteria during the day and evening at the Rosebank residence. It was noted that an isolated exceedance of 2dB(A) occurred at night on 17 September. Observations revealed that grain in bins, and to a lesser extent conveyors were responsible for the exceedances. We understand that action is continuing to be implemented to reduce future exceedances from these noise sources, as can be observed with quieter operation compared to previous surveys. In saying this, the existing Leq noise levels from extraneous noise sources are higher than those recorded from the Tangaratta site, and it is unlikely that residents would be disturbed by the minor isolated exceedance.

Only estimates of noise contributions from the Tangaratta site were possible during the day, as noise emissions from the Tangaratta site were only audible on occasion, due to the high levels of noise emanating from the Rosebank mill, birds and passing vehicles on Wallamore Road, etc. In saying this, our observations and subjective assessment do confirm that the Tangaratta plant was operating below the criteria during the day.
